DevOps Test

Now AYAPay is extending as usual and as Business requirements, we're about to create a new project in our organisation. As for now, the engineering team developed a new project but it is not yet fully completed.

Here is what DevOps is about to do now:

In that project, DevOps is about to do some restriction like:
 - To allow all IPs to `/` path
 - To restrict **116.206.137.18** to access `/admin` path.
 - To allow only requests coming from ALB to TargetGroup Security Group.

Requirements:
 - Above project will be hosted and running inside an EC2 (Ubuntu OS) instance as docker container
 - Docker services need to start automatically once the server has been rebooted.
 - To create Dockerfile for above repo that mentioned

Provision Infra:
 - To create **terraform scripts** to provision **all required services** especially EC2, ALB, TargetGroup, SecurityGroup and so on (*Jumpbox included*).

- That EC2 instance should be in a private **network** and **allow Jumpbox/Bastion to access that EC2** instance for some configuration.
